

31 March 2022

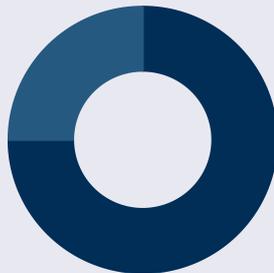

This document is intended for use by individuals who are familiar with investment terminology. Please contact your financial adviser if you need an explanation of the terms used.

<p>This fund is designed for customers invested in Standard Life Active Retirement. It may not be suitable as a standalone fund or if you're building your own portfolio from our full fund range.</p> <p>Standard Life Active Retirement is made up of three pots. This fund is pot 2. Pot 2 holds investments that aim to provide a better return than pot 1, while still remaining low to medium risk. This pot is ordinarily used as the second source to pay out any regular income or lump sum withdrawals.</p> <p>The fund holds one or more investment funds such as those investing in absolute return funds that aim to provide positive investment returns, regardless of whether markets are going up or down, over the medium to long term. They do this by using a wide range of investment strategies including those using derivatives. Derivatives are financial instruments whose value comes from movement in other investments, such as equities and currencies. The fund may also hold funds that invest in equities (shares), bonds (loans to a government or company), non-residential property (such as offices, shopping centres and shares in property development companies) and money market instruments. The investments in the fund can be from around the world, including emerging markets, which means that some of them will be in a foreign currency.</p> <p>The fund's holdings are reviewed regularly and may change over time. The fund doesn't provide any guarantee about the level of retirement income you'll receive.</p> <p>The value of investments within the fund can fall as well as rise and is not guaranteed - you may get back less than you pay in. The fund may use derivatives for the purposes of efficient portfolio management, reduction of risk or to meet its investment objective if this is permitted and appropriate. The sterling value of overseas assets held in the fund may rise and fall as a result of exchange rate fluctuations.</p>	Pension Investment Fund
	Blended Fund
	Quarterly

Launch Date	March 2015
Standard Life Current Fund Size (31/03/2022)	£125.8m
Standard Life Fund Code	NNGA
Volatility Rating (0-7)	2

The investment performance you will experience from investing in the Standard Life version of the fund will vary from the investment performance you would experience from investing in the underlying fund directly. This will be as a result of a number of differences, such as charges, tax and timing of investment.

Notes: The information shown relates to the past. Past performance is not a guide to the future. The value of your investment can go down as well as up. For the relevant charges on your policy please refer to your policy documentation.

Where a fund holds overseas assets the Sterling value of these assets may rise and fall as a result of exchange rate fluctuations.

Definition:

Volatility Rating - The volatility rating of a fund indicates how much the fund price might move compared to other funds. The higher the volatility rating, the less stable the fund price is likely to be. You can use this to help you decide how much risk you're comfortable taking with your investments. Volatility ratings are calculated on a scale of 0-7.

Money Market - may include bank and building society deposits, other money market instruments such as Certificates of Deposits (CDs), Floating Rate Notes (FRNs) including Asset Backed Securities (ABSs) and allowances for tax, dividends and interest due if appropriate.

Key Risks:

Standard Risks - What you get back depends on future investment performance and is not guaranteed. Past performance is not a guide to future returns. The value of your investment, and any income from it, may go down as well as up - you may get back less than you pay in.

Intangible risks and volatility - The risks of a fund can be measured in different ways. Volatility (a measure of how much a fund's price has varied in the past) will not necessarily always provide a complete picture of a fund's risk. Some risks are not represented in the movement of the unit price until they emerge and only then will they have a significant effect on a portfolio. The fund can invest in a wide variety of investment strategies and assets. Below we document the specific or heightened risks applicable to this fund rather than an exhaustive list.

Extensive use of Derivatives - In order to achieve its objectives an absolute return fund utilises a combination of traditional investments (such as equities, bonds and foreign exchange) and advanced techniques where it can use derivatives extensively. Derivatives are financial instruments which derive their value from an underlying asset, such as a share or bond, and are used routinely in global financial markets. Used carefully, derivatives offer an effective and cost-efficient way of investing in markets. However, derivatives can lead to increased volatility of returns in a fund, thus requiring a robust and extensive risk management process. While the fund will not borrow cash for investment purposes, the total value of exposures to markets will routinely exceed the Fund's net asset value. Derivatives may be Exchange Traded or Over the Counter (OTC).

Use of 'short' positions - Typically, UK authorised collective investment schemes invest on a 'long only' basis. The fund, by employing certain derivative techniques, will establish both 'long' and 'short' positions in individual stocks and markets. Investing on a 'long' basis means that the value of the derivative will rise or fall in the same direction as the underlying market value of the asset from which it is derived. If investments are made on a 'short' basis the value of the derivative will rise and fall in the opposite direction to the underlying market value of the asset from which it is derived.

Counterparty risk - The Investment Adviser may use one or more separate counterparties to undertake derivative transactions on behalf of the fund. From time to time the fund may be required to pledge collateral, and when this is required it will be paid from within the assets of the fund. When a derivatives contract moves in favour of the fund there is a risk that the counterparty may wholly or partially fail to honour their contractual obligations under the arrangement. The Investment Adviser assesses the creditworthiness of counterparties as part of the risk management process and will ordinarily hold collateral to mitigate this.

Active Fund Management - The majority of risks within traditional investment funds are driven by the type of investments held (i.e. equities, fixed interest or property, etc). The risks that fund management decisions add are generally of a smaller magnitude than those of the asset types themselves. The fund however doesn't have a structure where most of the returns are generated from traditional asset types. Rather, it derives most of its returns from very specific strategies. As a result of this the risks of the fund are driven primarily by these fund management decisions, and less by the characteristics of the underlying traditional asset types.

Correlation - The fund will invest in a diverse set of investment strategies which, in the opinion of the investment adviser, have attractive risk reward characteristics. While the breadth of the strategies is significant, should they start to exhibit closer correlation ie move in the same direction as one another, the fund may be subject to a higher level of risk and volatility than anticipated.
